◆ INTRODUCING

bro-os

your personal AI-powered knowledge operating system

engine · Claude (Bro) | vault · Obsidian | interface · Claude Code | version · 1.4

// 01

the problem

INPUT OVERLOAD

your day, every day

```
// inputs you generate:

→ meeting notes    –  scattered, unprocessed
→ PDF reports      –  read once, never found again
→ email threads    –  decisions buried inside
→ voice memos      –  good idea, zero follow-up
→ screenshots      –  in Downloads, forever

// result:
✗  todos spread across 4+ tools
✗  context lost between meetings
✗  docs take hours to write from scratch
✗  Claude re-explains itself every session
```

THE REAL COST

~2h wasted per day
re-finding information you already had

0% of your context reaches Claude.
You re-explain everything. Every. Single. Session.

> The bottleneck isn't intelligence.
> It's organized, accessible context.

// THE SOLUTION

a vault where your AI always has context.

01

you capture

Raw input → /inbox/. Zero processing. Just drop it.

02

Bro processes

Every evening, Bro structures, links, tags, archives.

03

you leverage

Ask anything. Bro knows your full context. Always.

// 03

the vault — folder structure

~/bro-os/

```
bro-os/
├── inbox/            ← YOU drop everything here
│   └── _archive/       auto-archived after processing
│
├── notes/            ← Bro manages · atomic KB · flat
│
├── resources/        ← immutable source documents
│   └── YYYY-MM/        PDFs · reports · regulations
│
├── outputs/          ← generated artifacts
│   └── YYYY-MM/        memos · decks · briefs
│
└── meta/
    ├── memory.md     ← Bro reads first, every session
    ├── taxonomy.md   ← living tag registry
    ├── todos.md      ← master to-do view (auto)
    ├── prompts/      ← /daily + /weekly session prompts
    ├── dashboards/   ← Dataview auto-views
    └── templates/    ← file schemas
```

SEPARATION OF CONCERNS

inbox/ ← your domain
Zero structure. Anything goes. Raw capture only.
You never write directly to /notes.

notes/ ← Bro's domain
Atomic. Flat. Tagged. Linked. English only.
One concept = one file. Grows by accretion.

resources/ ← source of truth
Immutable. PDFs, reports, regulations.
Always paired with a __meta.md companion.

meta/memory.md ← the cortex
Bro reads this at session start. Current state,
hot topics, open questions. Zero re-explanation.

// 04

three-speed operating model

01 CAPTURE

You · all day · ~0 min/item

Every raw input → inbox/ No classification. No tagging. No linking. Just drop it. Bro handles naming and archiving.

ZERO FRICTION

02 DAILY

Bro · evening · ~10–15 min

Bro empties inbox/ through a 3-phase pipeline: understand → enrich → process. Asks smart questions when uncertain. Tags, links, archives originals, extracts todos.

STRUCTURED KB

03 WEEKLY

Bro + you · Friday · ~20–30 min

Bro proposes. You approve. Consolidates appends, deduplicates, splits oversized files, reviews taxonomy. Self-tuning: proposes rule changes based on empirical vault evidence.

SELF-TUNING

// 05

daily processing — 3-phase pipeline

PHASE 1 UNDERSTAND

- → Read each inbox file in full
- → Identify: topic, people, project, entities, numbers
- → Search vault for related notes
- → Form interpretation hypothesis

rule: if ambiguous, ask user
max 3 questions per file

input: /inbox/ files
output: interpretation + gap list

PHASE 2 ENRICH

- → Link entities via [[wikilinks]]
- → Map to projects and areas
- → Propose tags from taxonomy
- → Flag gaps: blocking vs non-blocking

non-blocking gaps →
auto-creates #follow-up todos

input: interpretation + vault
output: enriched map + todos

PHASE 3 PROCESS

- → Append/create in notes/ with markers
- → Apply tags · bidir links
- → Extract todos with due dates
- → Archive original → _archive/

result: inbox = 0
KB +N notes · todos extracted

input: enriched map
output: structured knowledge

// 06

what Bro unlocks — with context, everything changes

docs & briefs

```
$ prepare a brief on Product_A margins
  reads: #economics notes tagged #product
  cross-refs: recent decisions + context
  → 2-page brief, institutional format
  → generated in ~3 min vs ~2h manual

$ draft follow-up email from today's meeting
  reads: meeting note + contact + project ctx
  → draft email, right register, right context
  → zero re-explanation needed
```

regulatory PDF

```
$ process this 47-page regulatory PDF
  reads: full doc via Claude Code
  → regulation note in /notes/
  → resource + __meta.md in /resources/
  → linked to active projects, auto
  → todos with deadlines, created
  → done in ~5 min vs ~3h manual
```

situational awareness

```
$ what's heating up I might be missing?
  reads: memory.md + recent reports
  → surfaces 3 items you'd forgotten
  → flags stalled decisions
  → suggests where to focus this week
```

THE MULTIPLIER EFFECT

📄 **Documentation & presentations**
Minutes instead of hours. Context already there.

✅ **Meeting → todos → tracking**
Automatic. Structured. Never dropped between sessions.

🔗 **Cross-project pattern recognition**
Connections you wouldn't catch manually, surfaced automatically.

// 07

zero todo debt

todos are created automatically. they are also closed automatically.

meta/todos.md — live dashboard

```
## ⚠️  Overdue — act now
- [ ] Review vendor contract  📅 2026-04-08 #project_x ⏫
- [ ] Send Q1 brief to board  📅 2026-04-09 #economics

## 🔥  Due today
- [ ] Interview prep — 3 questions for Contact_A

## 📅  Next 7 days
- [ ] Core provider shortlist  📅 2026-04-14 #project_x

## ✅  Closed this week
- [x] Align with Contact_D on arch  ✅ 2026-04-09
- [x] EBA GL extraction done        ✅ 2026-04-10
```

THE CLOSURE LOOP

01 CREATE

Bro extracts todos from every inbox file — meeting notes, PDFs, voice memos. Due dates and tags assigned automatically.

02 TRACK

meta/todos.md — one dashboard, live queries. Overdue · Today · By project · Follow-ups · Closed this week.

03 CLOSE

Every /daily opens with a triage: Bro surfaces overdue items, you reply done · drop · snooze in one message. Bro writes to source files.

close in the dashboard, in the note, or via Bro —
all paths write to the same source file. no sync needed.

// 08

the knowledge base — how notes work

ANATOMY OF A NOTE

notes/take_rate.md

```
---
tags: [concept, economics]
created: 2026-04-08
last_updated: 2026-04-10
---

# Take Rate

## Definition
The % of GMV retained as revenue after
merchant discounts and interchange costs.

## Key facts
- Current blended: see [[product_a]]
- Compression drivers: [[economics_moc]]

<!-- APPEND 2026-04-10 from [[meeting_x]] -->
Q1 data point: blended rate compressed 8bps.
```

DESIGN PRINCIPLES

atomic · one concept = one file
Never duplicate. Never sub-folder. Tags do all the categorization. Obsidian graph does the rest.

linked · [[wikilinks]] everywhere
Every entity = a node. Bro navigates the graph to give context-rich answers across projects.

tagged · emergent taxonomy
Tags emerge from real use. Broad domains first. Specifics only when volume justifies them.

append → consolidate
Daily adds <!-- APPEND --> markers. Weekly integrates them into clean prose. No data loss.

// 09

4 weeks to invisible infrastructure

W1

week 1 — bootstrapping

Bro asks more questions than usual (vault has no anchors yet). Sessions ~20 min. Normal — you're building the graph from scratch. First notes created.

W2

week 2 — stabilizing

Questions decrease. Vault has anchors. Sessions ~15–18 min. First weekly refactoring. Taxonomy stabilizes around 8–10 theme tags. Todos flowing automatically.

W3–4

week 3–4 — payback begins

Bro starts connecting things you'd forgotten. Sessions ~12 min. Docs generated in minutes. First MOCs emerge. You start asking more ambitious questions.

M2+

month 2+ — invisible infrastructure

You stop thinking about the system. You just capture and ask. bro-os becomes the operating layer of your work. Compound returns kick in.

// 10

day 1 setup — ~30 min, one time only

terminal

```
# 1. clone the vault
$ git clone github.com/you/bro-os ~/bro-os

# 2. open in Obsidian
$ open -a Obsidian ~/bro-os
  → "Open folder as vault" → trust author

# 3. install plugins (Settings → Community)
! Dataview    ← powers all dashboards
! Templater   ← dynamic templates
! Tasks       ← to-do queries

# 4. open Claude Code at vault root
$ cd ~/bro-os && claude
  → Bro reads CLAUDE.md automatically

# 5. fill meta/memory.md with your context
$ role · reporting line · current projects

# done. start capturing.
```

THE DAILY HABIT

🌅 **morning (~3 min)**

Open meta/dashboards/today.md in Obsidian.
Review overdue, today's todos, inbox depth.

☀️ **during the day (~0 min/item)**

Everything → inbox/. Don't think. Don't classify.
Just capture. Bro handles the rest.

🌙 **evening (~10–15 min)**

Run /daily in Claude Code.
Bro processes the inbox. You review the report.

📅 **Friday (~20–30 min)**

Run /weekly. Bro proposes. You approve.
Vault stays clean and self-tuning.
